

1. Which of the statements below about the fourth argument, [range lookup] in the **VLOOKUP** syntax is correct?

1 / 1 point

- ☐ This argument is optional, however, it has to be set to FALSE if you want to do a range lookup.
- ☐ This argument is not optional and has to be set to FALSE to do a range lookup.
- ☒ This argument is optional, however, it has to be set to FALSE if you want to do an exact match lookup.

✔ **Correct**

Yes, that's correct. The argument is optional - as indicated by the square brackets - but you need to tell the function whether you are looking for a range or exact match lookup.

2. Consider the following parameters:

1 / 1 point

This is the value we know: Table column with the heading **Materials**

This is our data set: Table with the name **Classification**

This is the column with the target value in it: Fourth from the left in the data set.

Which of the functions below was written correctly to successfully complete an **exact match VLOOKUP**?

☐ =VLOOKUP([@Materials],"Classification",4,0)

☒ =VLOOKUP([@Materials],Classification,4,0)

✔ **Correct**

Yes, that's correct. The lookup_value is showing as a structured reference as it is in a table. The table_array is presented by the name of the range, the third argument displays the col_index_num and finally, 0 is the same as FALSE and tells the function that we are looking for an exact match.

☒ =VLOOKUP([@Materials],Classification,4,FALSE)

✔ **Correct**

Yes, that's correct. The lookup_value is showing as a structured reference as it is in a table. The table_array is presented by the name of the range, the third argument displays the col_index_num and finally, FALSE tells the function that we are looking for an exact match.

☐ =VLOOKUP([@Materials],"Classification",4,FALSE)

3. In order to set a **VLOOKUP** to do an exact match, you have to complete the fourth argument by adding:

1 / 1 point

☒ The word FALSE

✔ **Correct**

Yes, that's correct. You can use the word FALSE to indicate that you are looking for an exact match.

☐ The word TRUE

☐ The number 1

☒ The number 0

✔ **Correct**

Yes, that's correct. You can use the number 0 to indicate that you are looking for an exact match.

4. When is it appropriate to use an exact match **VLOOKUP**?

- ☐ When you are using a horizontal table and you want the lookup value to exactly match the first row.
- ☒ When you are dealing with a lookup value with a unique identifier, such as bank account numbers, and you want to match to a vertical table.
- ☐ When the data is arranged in descending order and a range VLOOKUP is no longer appropriate.

✔ **Correct**

Yes, this answer is correct. This is a good use case for VLOOKUPs.
